

Determining the area to be heated

- 1) Draw to scale the room to be heated. Calculate the total surface area.
Calculate the area occupied by permanent fixtures such as counters, baths, commodes, etc.
- 2) Subtract from the total surface area.
- 3) The resultant square footage will be the heating area of the floor. Choose a cable of the next size shorter than the heating area calculated to allow for a buffer zone that will accommodate any excess cable, if necessary.
